

How is logging connected with climate change?

Trees release carbon dioxide, when the forests are cleared or disrupted.

Does logging contribute to global warming?

Yes, it does.

Can logging be done sustainably?

Yes, when the forest is too dense or it's infested with insects.

Why are trees important for the planet?

Trees absorb and store carbon dioxide.

What happens when too many trees are cut down?

Too many trees being cut down means less carbon dioxide is absorbed.

How can people help trees and forests?

People can help by protecting existing trees and planting new ones.

What is logging?

Logging is the process of cutting down trees for resources needed by humans.

Does logging cause air pollution?

Yes, logging can cause air pollution because of burning wood and tree destruction.

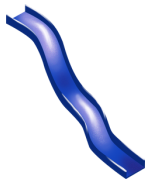

Forest Run - cards

Instructions for the board game:

When it's your turn you roll the dice and...

When you step on a rock, you answer a question and when you get it right you roll the dice again.

When you step on a slide, you move down.

When you step on a ladder you can move up.
